1. Problem Statement

Latha is taking a computer science course and has recently learned about infix and postfix expressions. She is fascinated by the idea of converting infix expressions into postfix notation. To practice this concept, she wants to implement a program that can perform the conversion for her.

Help Latha by designing a program that takes an infix expression as input and outputs its equivalent postfix notation.

Example

Input:

(3+4)5

Output:

34+5

Input Format

The input consists of a string, the infix expression to be converted to postfix notation.

Output Format

The output displays a string, the postfix expression equivalent of the input infix expression.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: A+B*C-D/E

Output: ABC*+DE/-

Answer

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <ctype.h>
#define MAX_SIZE 100
int top = -1;
char stack[MAX_SIZE];
void push(char item)
{
    if (top >= MAX_SIZE - 1) {
        printf("Stack Overflow\n");
        return;
    }
    top++;
    stack[top] = item;
}

char pop()
{
    if (top == -1) {
        printf("Stack Underflow\n");
```

```
        return -1;
    }
    char item = stack[top];
    top--;
    return item;
}
```

```
char peek()
{
    if (top == -1) {
        printf("Stack is empty\n");
        return -1;
    }
    return stack[top];
}
```

```
int is_operator(char ch)
{
    if (ch == '+' || ch == '-' || ch == '*' || ch == '/') {
        return 1;
    }
    return 0;
}
```

```
int precedence(char ch)
{
    if (ch == '+' || ch == '-') {
        return 1;
    } else if (ch == '*' || ch == '/') {
        return 2;
    }
    return 0;
}
```

```
void infix_to_postfix(char infix[], char postfix[])
{
    int i, j;
    i = j = 0;
```

```
    while (infix[i] != '\0') {
        if (isdigit(infix[i]) || isalpha(infix[i])) {
            postfix[j] = infix[i];
            i++;
```

```

        j++;
    } else if (is_operator(infix[i])) {
        while (top != -1 && precedence(infix[i]) <= precedence(peek())) {
            postfix[j] = pop();
            j++;
        }
        push(infix[i]);
        i++;
    } else if (infix[i] == '(') {
        push(infix[i]);
        i++;
    } else if (infix[i] == ')') {
        while (top != -1 && peek() != '(') {
            postfix[j] = pop();
            j++;
        }
        pop();
        i++;
    }
}

while (top != -1) {
    postfix[j] = pop();
    j++;
}
postfix[j] = '\0';
}
int main()
{
    char infix[MAX_SIZE];
    char postfix[MAX_SIZE];
    scanf("%s", infix);

    infix_to_postfix(infix, postfix);

    printf("%s", postfix);

    return 0;
}

```

Marks : 10/10

2. Problem Statement

Raj is a software developer, and his team is building an application that processes user inputs in the form of strings containing brackets. One of the essential features of the application is to validate whether the input string meets specific criteria.

During testing, Raj inputs the string "([()]){}". The application correctly returns "Valid string" because the input satisfies the criteria: every opening bracket (, [, and { has a corresponding closing bracket),], and }, arranged in the correct order.

Next, Raj tests the application with the string "([)]". This time, the application correctly returns "Invalid string" because the opening bracket [is incorrectly closed by the bracket), which violates the validation rules.

Finally, Raj enters the string "{[()]}" . The application correctly identifies it as a "Valid string" since all opening brackets are matched with the corresponding closing brackets in the correct order.

As a software developer, Raj's responsibility is to ensure that the application works reliably and produces accurate results for all input strings, following the validation rules. He accomplishes this by using a method for solving such problems.

Input Format

The input comprises a string representing a sequence of brackets that need to be validated.

Output Format

The output prints "Valid string" if the string is valid. Otherwise, it prints "Invalid string".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: (([])){}

Output: Valid string

Answer

```
#include <stdio.h>
```

```
#include <stdbool.h>
```

```
#include <string.h>
```

```
bool isValid(char *s) {  
    int len = strlen(s);  
    char stack[len];  
    int top = -1;  
    for (int i = 0; i < len; i++) {  
        if (s[i] == '(' || s[i] == '{' || s[i] == '[') {  
            stack[++top] = s[i];  
        } else if (s[i] == ')' && top != -1 && stack[top] == '(') {  
            top--;  
        } else if (s[i] == '}' && top != -1 && stack[top] == '{') {  
            top--;  
        } else if (s[i] == ']' && top != -1 && stack[top] == '[') {  
            top--;  
        } else {  
            return false;  
        }  
    }  
    return top == -1;  
}
```

```
int main() {  
    char s[100];  
  
    scanf("%s", s);  
    if (isValid(s)) {  
        printf("Valid string\n");  
    } else {  
        printf("Invalid string\n");  
    }  
    return 0;  
}
```

3. Problem Statement

Rithi is building a simple text editor that allows users to type characters, undo their typing, and view the current text. She has implemented this text editor using an array-based stack data structure.

She has to develop a basic text editor with the following features:

Type a Character (Push): Users can type a character and add it to the text editor. Undo Typing (Pop): Users can undo their typing by removing the last character they entered from the editor. View Current Text (Display): Users can view the current text in the editor, which is the sequence of characters in the buffer. Exit: Users can exit the text editor application.

Write a program that simulates this text editor's undo feature using a character stack and implements the push, pop and display operations accordingly.

Input Format

The input consists of integers corresponding to the operation that needs to be performed:

Choice 1: Push the character onto the stack. If the choice is 1, the following input is a space-separated character, representing the character to be pushed onto the stack.

Choice 2: Pop the character from the stack.

Choice 3: Display the characters in the stack.

Choice 4: Exit the program.

Output Format

The output displays messages according to the choice and the status of the stack:

1. If the choice is 1, print: "Typed character: <character>" where <character> is the character that was pushed to the stack.
2. If the choice is 2, print: "Undo: Removed character <character>" where <character> is the character that was removed from the stack.
3. If the choice is 3, and if the stack is empty without any characters, print "Text

editor buffer is empty. Nothing to undo."

4. If the choice is 3, print: "Current text: <character1> <character2> ... <characterN>" where <character1>, <character2>, ... are the characters in the stack, starting from the last pushed character.
5. If the choice is 3, and there are no characters in the stack, print "Text editor buffer is empty."
6. If the choice is 4, exit the program.
7. If any other choice is entered, print "Invalid choice"

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1 H

1 A

3

4

Output: Typed character: H

Typed character: A

Current text: A H

Answer

```
#include <stdio.h>
```

```
#include <stdbool.h>
```

```
#define MAX_TEXT_LENGTH 100
```

```
char textStack[MAX_TEXT_LENGTH];
```

```
int stackTop = -1;
```

```
void initialize() {  
    stackTop = -1;  
}
```

```
bool isFull() {  
    return stackTop == MAX_TEXT_LENGTH - 1;  
}
```

```
bool isEmpty() {  
    return stackTop == -1;
```

```
}
```

```
void pushCharacter(char value) {  
    if (!isFull()) {  
        textStack[++stackTop] = value;  
        printf("Typed character: %c\n", value);  
    }  
}
```

```
void popCharacter() {  
    if (!isEmpty()) {  
        char removed = textStack[stackTop--];  
        printf("Undo: Removed character %c\n", removed);  
    } else {  
        printf("Text editor buffer is empty. Nothing to undo.\n");  
    }  
}
```

```
void view() {  
    if (isEmpty()) {  
        printf("Text editor buffer is empty.\n");  
    } else {  
        printf("Current text: ");  
        for (int i = stackTop; i >= 0; i--) {  
            printf("%c ", textStack[i]);  
        }  
        printf("\n");  
    }  
}
```

```
int main() {  
    int choice;  
    char input;  
  
    initialize();  
  
    while (true) {  
        if (scanf("%d", &choice) != 1) {  
            while (getchar() != '\n');  
            continue;  
        }  
    }
```

```
switch (choice) {  
    case 1:  
        scanf(" %c", &input);  
        pushCharacter(input);  
        break;  
    case 2:  
        popCharacter();  
        break;  
    case 3:  
        view();  
        break;  
    case 4:  
        return 0;  
    default:  
        printf("Invalid choice\n");  
}  
}  
  
return 0;  
}
```
